Globular clusters

Les amas globulaires

Cúmulos globulares

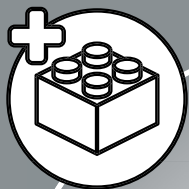

Globular clusters consist of tens of thousands to millions of stars bound tightly by gravitational attraction. Often spherical in shape, these clusters have been detected in all known types of galaxies – with around 150 detected so far in the Milky Way alone. Most stars in each cluster have formed around the same time, and their stability allows them to live long lives. One of the oldest known is Messier 15, estimated at around 12 billion years old.

Les amas globulaires sont constitués de dizaines de milliers à des millions d'étoiles étroitement liées par l'attraction gravitationnelle. Souvent de forme sphérique, de tels amas ont été détectés dans tous les types de galaxies connus, dont environ 150 rien que dans la Voie lactée. La plupart des étoiles de chaque amas se sont formées à peu près en même temps et leur stabilité leur permet de vivre longtemps. L'un des plus anciens connus est Messier 15, dont l'âge est estimé à environ 12 milliards d'années.

Los cúmulos globulares están formados por decenas de miles o millones de estrellas fuertemente unidas por la atracción gravitatoria. Frecuentemente con forma esférica, estos grupos de estrellas se han detectado en todos los tipos conocidos de galaxias; solo en la Vía Láctea, se han detectado alrededor de 150 de ellos. La mayoría de las estrellas de cada cúmulo se formaron más o menos a la vez, y su estabilidad les permite existir por mucho tiempo. Uno de los más antiguos conocidos es el objeto Messier 15, cuya edad se estima en unos 12.000 millones de años.
